Idea<sup>s</sup>

European Space Agency

High Speed Initiative (Workshop Porto, October 21<sup>st</sup>, 2016)

# Why this initiative?

- ❑ High-speed air transport remains a “big challenge” both as an engineering and a business case.
- ❑ It has the potential to transform our lives and economies.
- ❑ It is a complex challenge where many disciplines are interlinked (engineering, business, design, etc).
- ❑ Addressing this complexity requires a large collaborative effort engaging and educating different actors and institutions.

# Why an educational approach (driven by engineering)?

- ❑ A challenge of a 300 passenger high-speed airplane...we think is a highly motivational project for a wide range of students (...the “I contributed to it” philosophy).
- ❑ Students think without prejudices...they challenge all assumptions.
- ❑ Developing an open platform for such a collaborative effort acts as a pilot project for other engineering & societal student challenges

# Are we ignoring past efforts or industry?

- ❑ Absolutely NOT (We are aware: Hikari, LAPCAT, etc).
- ❑ Industry advice and help is very welcome in sharing information. Our main driver is the educational component and openness.

# Will CERN, EASN and ESA now build together a high-speed aircraft?

- ❑ Absolutely NOT (Our focus is HEP, Space and Aviation Research respectively).
- ❑ Educating next-generation of scientists and engineers is important to us.
- ❑ We are interested in new collaborative platforms.

# General characteristics (1)

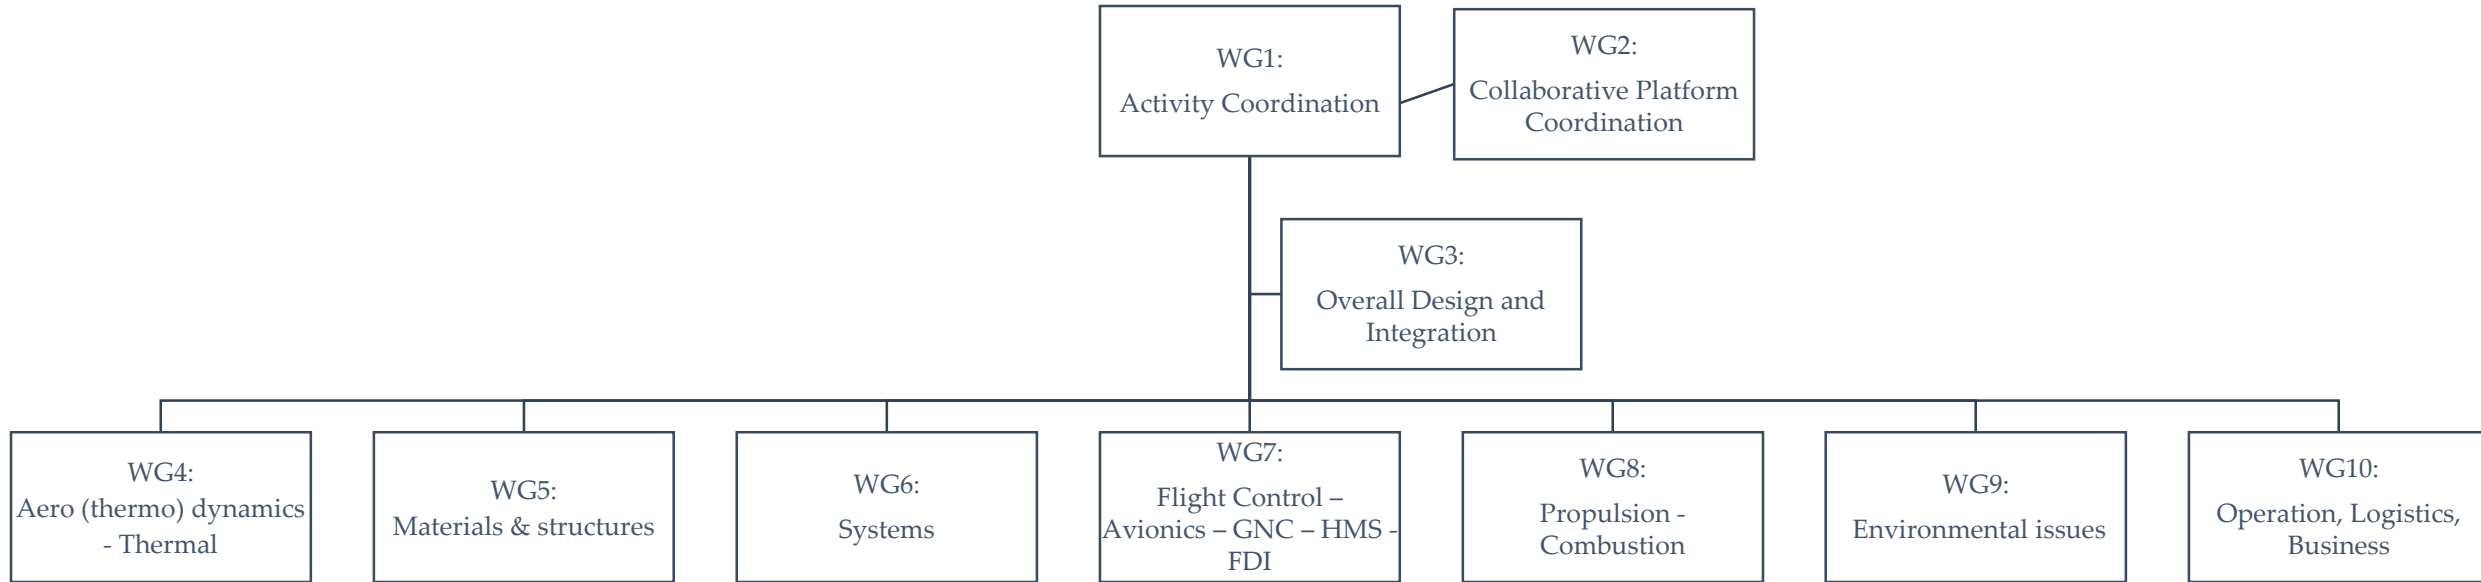

- ❑ Educational and collaborative initiative with a strong engineering component, as proposed by CERN-EASN-ESA.
- ❑ Long term (approx. 7 years).
- ❑ Holistic (i.e. not only the vehicle but also infrastructures, regulations, business models, user-experience, etc).
- ❑ “Out-of-the-box” thinking when possible (i.e. technology dictate the rules but technology can be challenged).
- ❑ Open to all institutions willing to participate as well as open to outside world (i.e. no NDAs, “no secrets”).

## General characteristics (2)

- ❑ Requires in-kind contributions.
- ❑ Public funding can help -- but it is not a must.
- ❑ Students are the main executors under expert supervision.
- ❑ Remote collaboration through tailored platform will be promoted.
- ❑ Final “Product Integration” done by the institutions (not left to students)

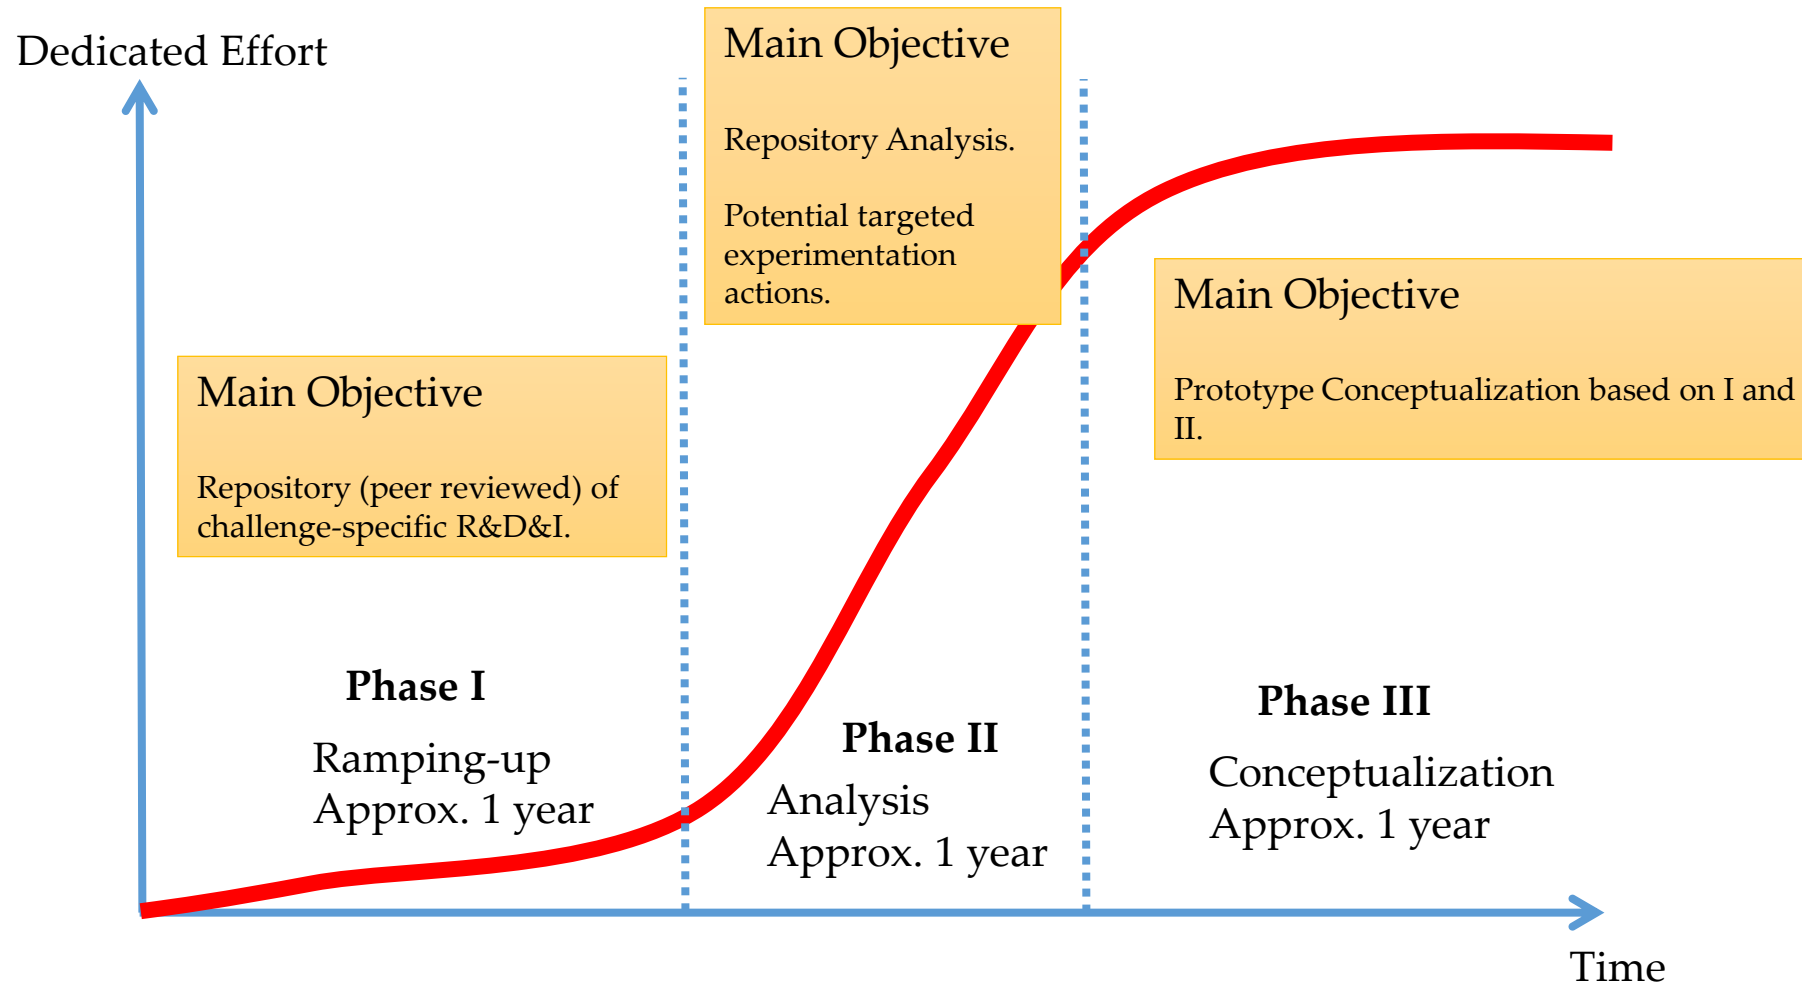

# Suggested Working Groups

# Initiative overview

Minimum effort is 3 years;

If EU funding available it could be extended.

# Phase I: Ramping-up

## Resources

- Existing curricular activities and resources in organizations.
- CERN first version of collaborative platform available (allows creating repository).

## Effort

- Each organization requires limited effort.

## Objectives

- After 1 year elaborate a peer reviewed database out of existing R&D&I activities specifically **challenge oriented**.
- R&D&I database (or repository) based mainly on students' projects (i.e. master thesis, PhDs, etc).

## Modus Operandi

- Distribute participating organizations around the challenges (Work Groups).
- Each WG has an overall coordinator.
- Materials uploaded in repository should be peer reviewed by professors of each institution.

# Phase I: Ramping-up

## Must have

- In-kind contribution of participants.
- Basic collaborative platform.
- At least 2 meetings among WG Coordinators.

## Nice to have

- Small EU funding (i.e. CSA type or COST) to cover “ramping-up efforts” (i.e. meetings, workshops, etc).
- General Workshop(s) for all participant organizations (i.e. to share and check challenges and repository).

# Phase II: Repository Analysis

## Resources

- **Within existing or beyond** curricular activities in organizations.
- Enhanced version of collaborative platform (CERN).

## Effort

- Effort from each WG coordinator beyond “daily activities”.

## Objectives

- After 2 years elaborate a synthesis of the gathered **challenge oriented** R&D&I.
- Propose complementary and missing key experimentation/ simulation suitable to be realised by students.
- Integrate results in the synthesis.

## Modus Operandi

- Each WG coordinator spends time elaborating synthesis of results of Phase I and indicates key missing experiments/ simulations.
- Each organization determines the feasibility to carry on key missing experimentation/ simulation
- Each WG coordinator elaborates a final report per challenge.

# Phase II: Repository Analysis

## Must have

- In-kind contribution of participants.
- Enhanced collaborative platform.
- Final synthesis report per challenge.
- At least 3 meetings among WG Coordinators.

## Nice to have

- EU funding to cover efforts related to synthesis and potential experimentation as well as other activities (i.e. design of enhanced collaborative platform, meetings, workshops, etc).
- General Workshop(s) for all participant organizations (i.e. to share and check challenges vs. synthesis).
- Extra key experiments/simulations based on synthesis report.

# Phase III: Conceptualization

Resources	Effort	Objectives	Modus Operandi
<ul style="list-style-type: none"><li>• <b>Existing and beyond</b> curricular activities in organizations.</li><li>• Enhanced collaborative platform.</li></ul>	<ul style="list-style-type: none"><li>• Each organization requires effort beyond “daily activities”.</li></ul>	<ul style="list-style-type: none"><li>• After 3 years conceptualise a prototype of the future 300 passenger civil supersonic aircraft.</li></ul>	<ul style="list-style-type: none"><li>• Organise participating organizations around the challenges (Work Groups).</li><li>• Each WG has an overall coordinator.</li><li>• General student activity: conceptualize prototype with information of all WGs.</li></ul>

# Phase III: Conceptualization

## Must have

- In-kind contribution of participants.
- Enhanced collaborative platform allowing WG collaborative work (synergies).
- Final conceptualization report.
- At least 3 meetings among WG Coordinators.
- General Workshop(s) for all participant organizations (i.e. to share and check challenges).

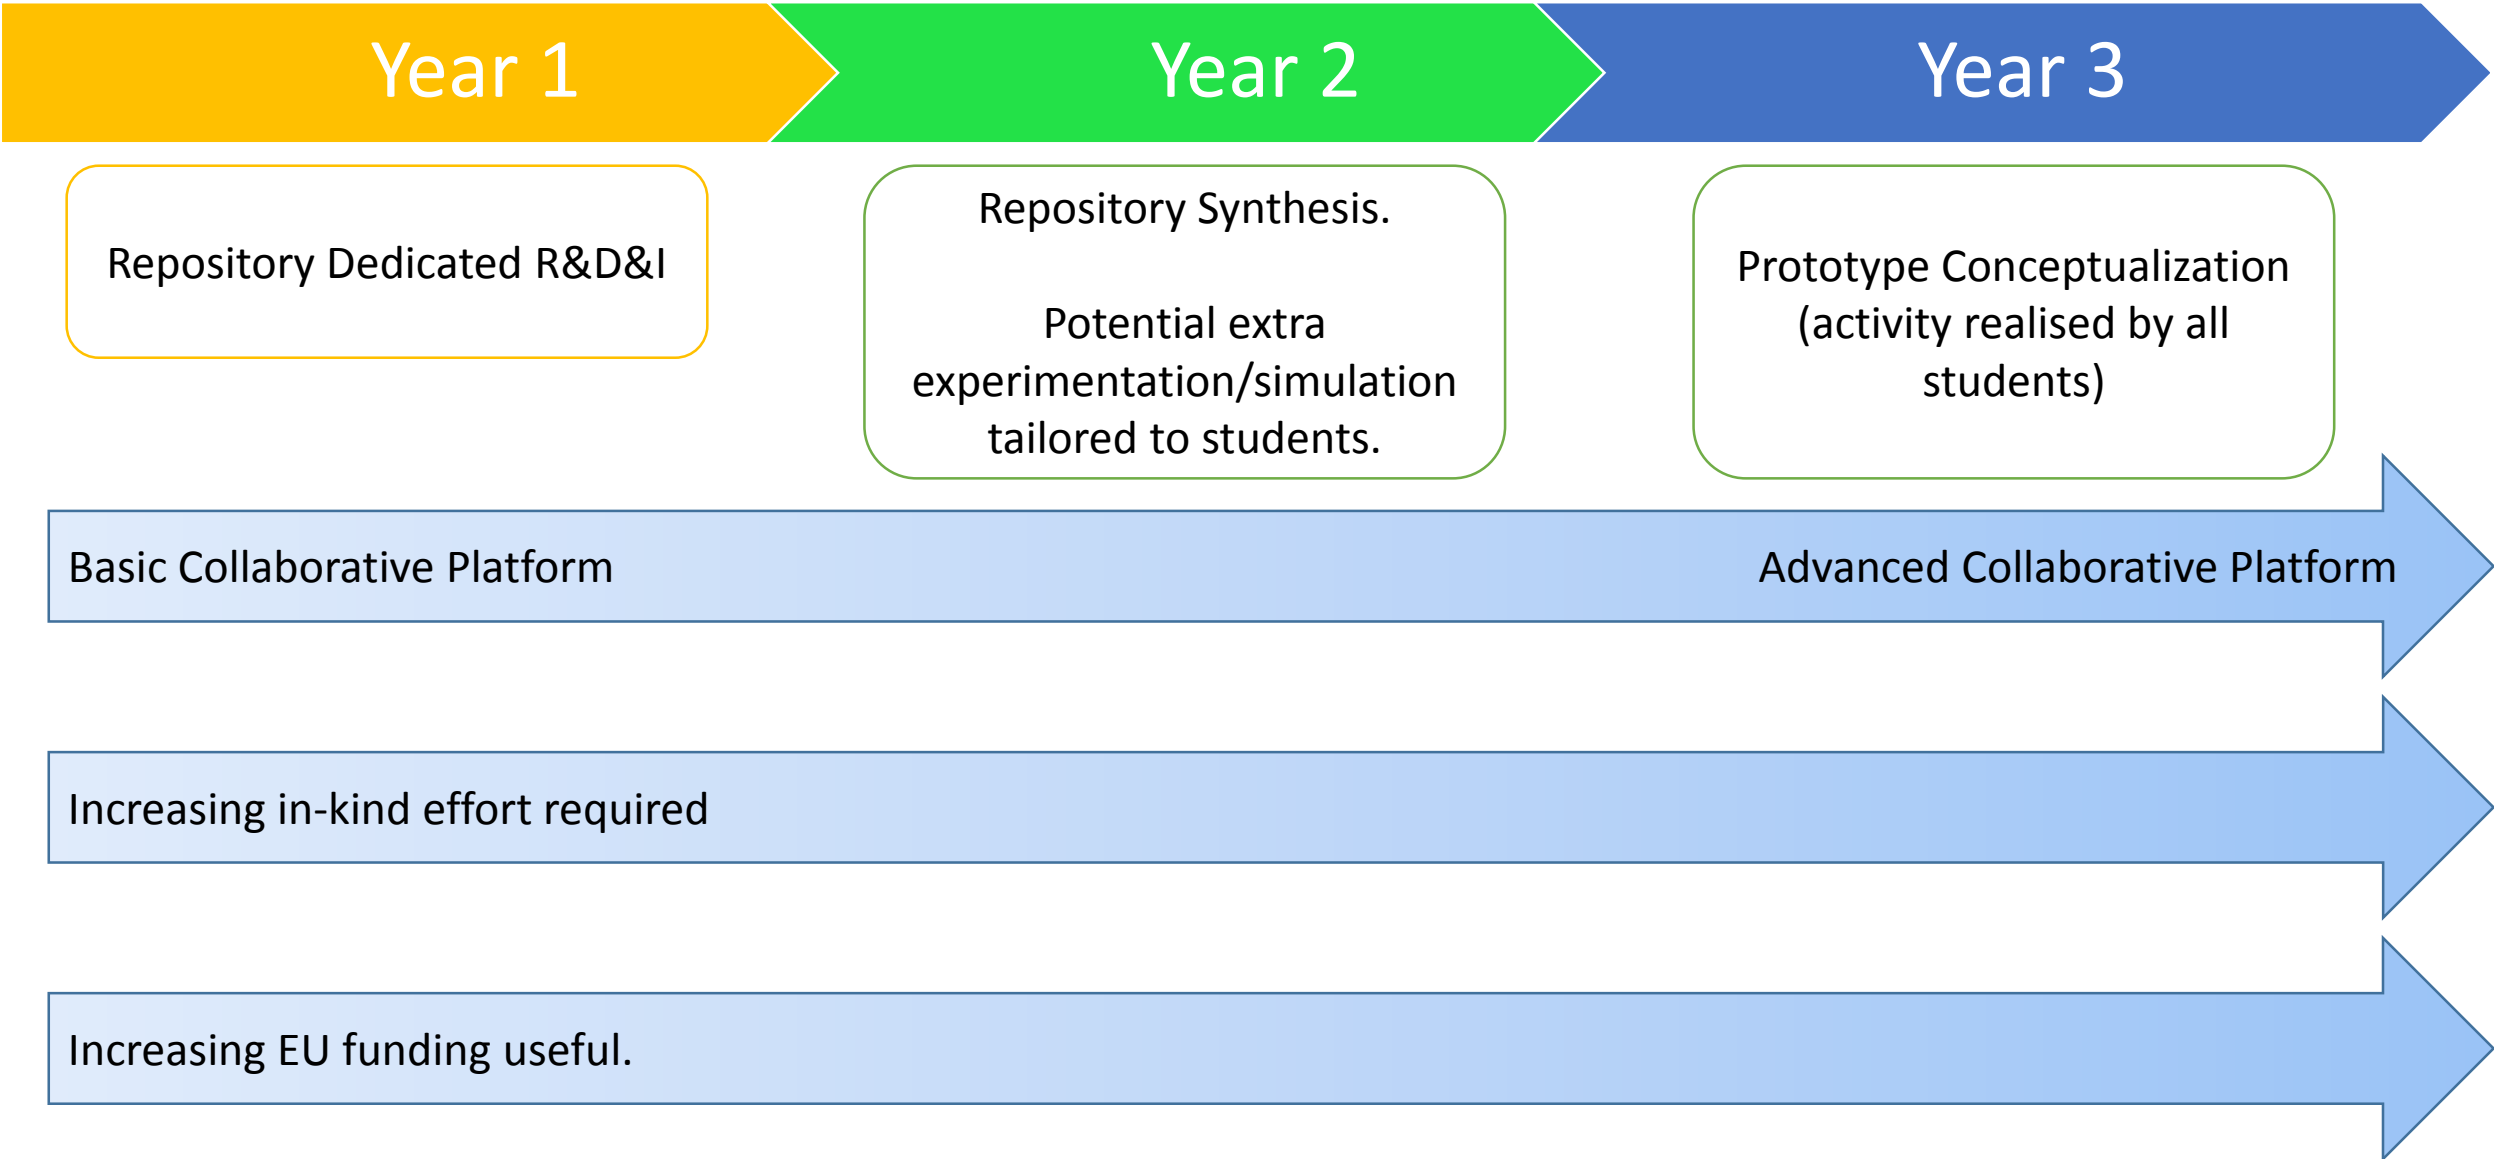

## Nice to have

- EU funding to cover efforts related to conceptualization and potential experimentation as well as other activities (i.e. design of enhanced collaborative platform, meetings, workshops, etc).

# High Level Gantt Chart

Minimum effort is 3 years;  
If EU funding available it could be extended.

## Next steps: organizing the ramping up

- ❑ Identify those of you willing to take part in this initiative.
- ❑ Populate the different Working Groups and challenges.
- ❑ Nominate WG Coordinators.
- ❑ Start developing the R&D&I repository.

Thanks for your  
presence here today
